

Understanding your photo folders

What each export contains, and how split images fit together.

The delivery may include several versions of the photographs, each intended for a different use. The folder names make it easy to choose the right version without changing the original files.

Folders in the delivery

<code>standard/</code>	Regular finished-photo exports for general sharing and saving.
<code>lightweight/</code>	Smaller file-size copies intended for websites, where quicker loading is useful.
<code>raw/ (if included)</code>	Original camera files (NEF in this workflow), with matching <code>.XMP</code> sidecars when provided. These are source files for photo-editing software, not finished exports.
<code>instagram/</code>	Clean, portrait-format exports prepared for Instagram.
<code>instagram-framed/</code>	Alternate Instagram exports with a simple frame.

Instagram format and filenames

Instagram images use the standard portrait size of **1080 × 1440 pixels** (3:4 width-to-height) with the default export settings. Landscape photographs are split into panels so the full scene can be viewed together in a swipe-through carousel. The framed folder also includes a complete, framed version of each two-panel landscape photo, named with `_full`.

<code>IMG_2048.jpg</code>	A portrait or square source photo, cropped to the portrait canvas.
<code>IMG_2049_L.jpg</code>	The left panel of a landscape photo.
<code>IMG_2049_R.jpg</code>	The right panel of that same photo. Put the <code>_L</code> and <code>_R</code> images next to each other, in that order, to see the complete scene.
<code>IMG_2049_full.jpg</code>	The complete landscape photo in one frame; this version is in <code>instagram-framed/</code> .
<code>IMG_2050_01.jpg</code>	For especially wide photographs, three panels are numbered left to right: <code>_01</code> , <code>_02</code> , then <code>_03</code> .

A note on the frame

The framed folder is an alternate presentation, not a different photograph. The frame is white by default and 30 pixels wide. Both folders contain portrait-sized panels; the original full-width composition is provided separately as `_full` where applicable.

If the Instagram folders are grouped together in the delivery, their parent folder may be named `instagram-export/`. The `raw/` folder is included only when original camera files are part of the handoff.

Image dimensions and split patterns describe the standard export settings. Individual filenames vary with the source photographs.
